Your own mix review server.

A step-by-step guide to putting Studio Review online for your studio and sending clients their first link. No previous server experience needed.

How to read this guide

Grey boxes with dark backgrounds are commands. Type them (or copy them) into **Terminal** exactly as shown, then press Return. Lines starting with `#` are comments explaining the command, so you don't need to type them.

```
# This is a comment
ssh review
```

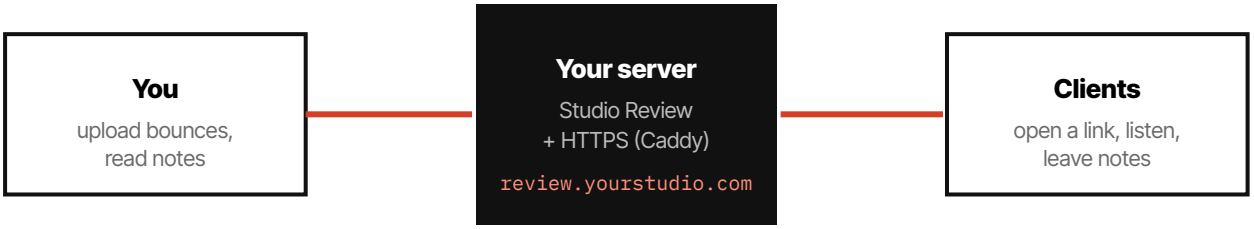

Anything in `RED_CAPITALS` inside a command is something you replace with your own value, like your server's IP address.

> **MAC AND WINDOWS**
> The guide is written for a Mac. On Windows 10/11, use **PowerShell** wherever it says Terminal; the `ssh` commands are the same. Where something differs, there's a Windows note.

> **TIME**
> About an hour from start to first link, most of it waiting for things to install.

00 What you're building

Studio Review is a private website just for your studio. You upload mixes, clients open a link and leave notes at exact timecodes, and you see everything in one place.

Rented from a cloud host for about $12/month. Only you and people with a link can see anything.

The pieces

PIECE	WHAT IT IS	COST
A server	A small Linux computer you rent in a data center (a "droplet" on DigitalOcean). It runs 24/7 so clients can listen any time.	~$12/mo
Storage volume	An extra disk attached to the server for your audio. You can grow it later.	$0.10/GB/mo (100 GB = $10)
A domain name	The web address, e.g. `review.yourstudio.com`. If you already own your studio's domain, you'll just add a **subdomain** to it.	Usually free (you own one)
Docker	Free software that packages the app and everything it needs, so it runs the same everywhere.	Free
Caddy	Included. Gives your site the padlock (HTTPS) automatically and renews it forever.	Free

> **OTHER HOSTS**
> This guide uses DigitalOcean because its screens are simple. Hetzner, Linode, Vultr and similar hosts work the same way: create an Ubuntu server, add your SSH key, and continue from chapter 05. Prices above were correct when written; check the host's site.

01 Before you start

5 min

Gather these first. Write the answers in the blanks; you'll need them later.

	YOU NEED	NOTES
☐	The **studio-review** folder, unzipped	Put it somewhere easy, like your Downloads folder.
☐	A **DigitalOcean** account with a payment card	Sign up at digitalocean.com.
☐	Access to your **domain's DNS settings**	Wherever you bought your domain: Squarespace, GoDaddy, Namecheap, Cloudflare, Google/Squarespace Domains, etc.
☐	About an hour	Mostly waiting.

Your values

WHAT	EXAMPLE	YOURS
Review address (subdomain)	`review.northside.studio`	_____
Name in the header (BRAND)	`Northside Review`	_____
Your name on notes	`Sam`	_____
Server IP address (chapter 04)	`203.0.113.10`	_____
Volume folder (chapter 06)	`/mnt/volume_nyc1_01`	_____

> **DON'T WRITE YOUR PASSWORDS HERE**
> Keep your sign-in password and SSH passphrase in a password manager (1Password, Apple Passwords, Bitwarden). If you forget the sign-in password, chapter 13 shows how to reset it, but it's easier not to need that.

02 Try it on your computer

optional · 10 min

You can skip straight to chapter 03. But if you'd like to click around before renting a server, this runs Studio Review on your own Mac. Clients won't be able to reach it; it's just for you to try.

1 Install Homebrew

Homebrew installs developer tools on a Mac. Open **Terminal** (Applications → Utilities) and paste the install line from **brew.sh**. Follow its instructions at the end (it may ask you to run two extra lines).

2 Install Node and ffmpeg

```
brew install node ffmpeg
```

3 Go into the folder and set a password

```
# Type "cd " (with a space), then drag the studio-review folder into the Terminal window, then Return
cd ~/Downloads/studio-review
cp .env.example .env
open -e .env
```

TextEdit opens the settings file. Change `ADMIN_PASSWORD=change-me-please` to a password of your own, then save and close.

4 Install and start

```
npm install
npm start
```

Open **http://localhost:8080** in your browser and sign in. To stop it, click the Terminal window and press **Control-C**.

> **WINDOWS**
> Install Node from nodejs.org and ffmpeg from `winget install ffmpeg` in PowerShell, then use `copy .env.example .env` and `notepad .env`. Alternatively, if you have Docker Desktop, run `docker compose up --build review` in the folder instead of steps 2 and 4.

> **"ENOENT: NO SUCH FILE … PACKAGE.JSON"**
> This means Terminal isn't inside the studio-review folder. Do step 3's `cd` again; `ls` should list `package.json`.

03 Make an SSH key

5 min

An SSH key is how your computer proves who it is to the server, instead of a password. It's two files: a **private** key that never leaves your computer, and a **public** key you give to DigitalOcean.

1 Create the key

```
ssh-keygen -t ed25519 -C "studio-review"
```

Press Return to accept the default location. Then it asks for a **passphrase**. Choose one and **save it in your password manager now**. Nothing appears on screen while you type; that's normal.

2 Copy the public key

```
pbcopy < ~/.ssh/id_ed25519.pub
```

It's now on your clipboard, ready for the next chapter. It's one long line starting with `ssh-ed25519`.

Windows: `Get-Content $env:USERPROFILE\.ssh\id_ed25519.pub | Set-Clipboard`

> **NEVER SHARE THE PRIVATE KEY**
> The file **without** `.pub` (`id_ed25519`) stays on your computer. Only the `.pub` file goes to DigitalOcean.

> **ALREADY HAVE A KEY?**
> If `ssh-keygen` says the file already exists, answer **n** and just use step 2 to copy your existing key, as long as you know its passphrase. If you've forgotten it, chapter 14 explains how to make a fresh key and add it.

04 Create your server

10 min

In DigitalOcean, click **Create** → **Droplets**. Choose these options (the screens change from time to time, but the choices stay the same).

SETTING	CHOOSE	WHY
Region	The one closest to you and most of your clients	Faster playback.
Image	**Ubuntu 24.04 (LTS) x64**	The long-term-support version this guide is tested with.
Size	**Basic** → **Regular** → **2 GB RAM / 1 CPU** (about $12/mo)	Plenty for one studio. The $6 1 GB size works but processes uploads more slowly.
Volume	**Add Volume**, e.g. **100 GB**, "Automatically format & mount"	Your audio lives here, separate from the system disk, so it's easy to grow and snapshot.
Authentication	**SSH Key** → **New SSH Key**, paste from chapter 03, name it after your computer	Lets you log in with your key.
Backups	Optional	Backs up the system disk weekly. Your audio is protected by volume snapshots instead (chapter 13).
Hostname	Something like `studio-review`	Just a label.

1

Create the droplet

Click **Create Droplet**. After a minute it shows an **IP address** like `203.0.113.10`. Write it in the blank on page 3.

2

Add a shortcut on your computer

So you can type `ssh review` instead of the IP address every time:

```
open -e ~/.ssh/config     # if it says the file doesn't exist: touch ~/.ssh/config first
```

Add these lines at the bottom, with your IP, and save:

```
Host review
  HostName YOUR_SERVER_IP
  User root
  IdentityFile ~/.ssh/id_ed25519
  AddKeysToAgent yes
  UseKeychain yes
```

Windows: notepad $env:USERPROFILE\.ssh\config — leave out the UseKeychain line.

3 Log in for the first time

```
ssh review
```

It asks "Are you sure you want to continue connecting?" Type **yes**. Enter your key's passphrase. When you see a prompt like `root@studio-review:~#`, you're on the server.

05 Point your domain at it

5 min + waiting

Tell the internet that `review.yourstudio.com` lives at your server's IP address. You do this where your domain is managed, not at DigitalOcean.

1

Open your domain's DNS settings

Log in where you bought the domain and find **DNS**, **DNS records** or **Manage DNS**.

2

Add an A record

FIELD	ENTER
Type	**A**
Host / Name	**review** (just the first word, not the whole address)
Value / Points to / Data	Your server's IP address
TTL	Default (or 1 hour)

If you use Cloudflare, set the cloud icon to **DNS only** (grey) so Caddy can get its certificate.

3

Check it

Usually takes a few minutes, occasionally an hour. On your computer:

```
ping -c 3 review.yourstudio.com
```

When the replies show your server's IP, it's working. (Press Control-C if it keeps going.) Carry on with chapter 06 while you wait.

> **DON'T TOUCH YOUR MAIN WEBSITE**
> You're only adding a new record. Leave the existing records (for your main site and email) exactly as they are.

06 Prepare the server

10 min

Log in with `ssh review` and run these commands one block at a time.

1 Update the system

```
apt update && apt upgrade -y
```

> **A PINK OR PURPLE SCREEN ABOUT SSHD_CONFIG?**
> Choose **"keep the local version currently installed"** and press Return. This keeps DigitalOcean's settings, which let your key log in.

If it says a restart is needed, run `reboot`, wait a minute, then `ssh review` again.

2 Install Docker

```
curl -fsSL https://get.docker.com | sh
```

Check it worked: `docker compose version` should print a version number.

3 Turn on the firewall

```
ufw allow OpenSSH
ufw allow 80
ufw allow 443
ufw --force enable
```

This blocks everything except logging in (SSH) and the website.

4 Find your volume's folder

```
ls /mnt
```

You'll see one name, like `volume_nyc1_01`. Write the full path, `/mnt/volume_nyc1_01`, in the blank on page 3. Then make a folder on it for the app:

```
mkdir -p /mnt/volume_nyc1_01/review
```

> **UNDERSCORES, NOT DASHES**
> DigitalOcean names the volume with dashes (`volume-nyc1-01`) on the website but mounts it with **underscores** (`volume_nyc1_01`). Always use what `ls /mnt` shows.

5

Make the app's folder

```
mkdir -p /opt/studio-review
exit
```

`exit` logs you out, back to your own computer, for the next chapter.

07 Upload and configure

10 min

1 Copy the app to the server

On **your computer** (not logged into the server):

```
rsync -av --exclude node_modules --exclude data --exclude .env \
  ~/Downloads/studio-review/ review:/opt/studio-review/
```

Adjust `~/Downloads/studio-review/` if you put the folder elsewhere. Keep the slash at the end.

Windows (no rsync): `scp -r $env:USERPROFILE\Downloads\studio-review\* review:/opt/studio-review/`

2 Create your settings file

```
ssh review
cd /opt/studio-review
cp .env.example .env
nano .env
```

nano is a simple text editor. Use the arrow keys to move. Change these lines:

```
ADMIN_PASSWORD=a-long-password-you-will-remember
DOMAIN=review.yourstudio.com
BRAND=Northside Review
OWNER_NAME=Sam
```

Save with **Control-O**, then Return; exit with **Control-X**.

> **PASSWORD RULES**
> At least 8 characters. **Don't use `$` or quote marks**; they confuse Docker and you'll get "wrong password" at sign-in. Letters, numbers, dashes and other symbols are fine. A few random words joined with dashes is easy and strong.

3 Store audio on the volume

```
nano docker-compose.yml
```

Find this line (under `volumes:` in the `review` section):

```
      - ./data:/data
```

and change it to your volume folder from chapter 06, keeping the `:/data` at the end:

```
      - /mnt/volume_nyc1_01/review:/data
```

Save (Control-O, Return) and exit (Control-X). Indentation matters in this file; keep the dash lined up with the line below it.

08 Start it and sign in

5 min

1 Start Studio Review

```
cd /opt/studio-review
docker compose up -d --build
```

The first time takes 2–4 minutes while it downloads and builds. When it finishes you'll see `Started` for **review** and **caddy**.

2 Open your address

Go to **https://review.yourstudio.com**. The first visit can take up to a minute while Caddy gets the HTTPS certificate. You'll see the sign-in page with your BRAND name.

The sign-in page. Only you sign in here; clients never see it.

3 Sign in

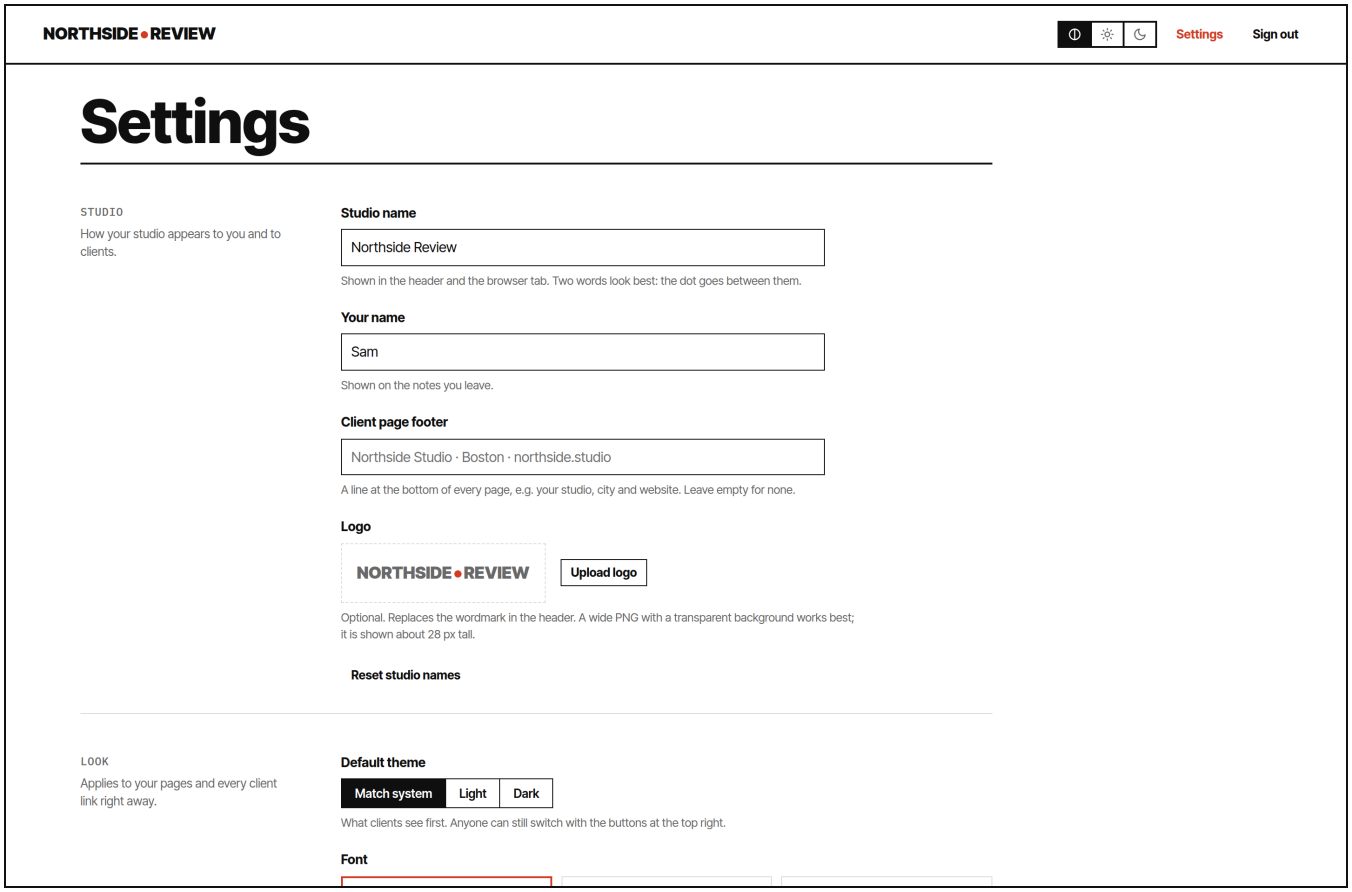

Use the `ADMIN_PASSWORD` from your `.env`. That's it, you're live.

> **BOOKMARK IT**
> On a Mac in Safari, **File → Add to Dock** turns the site into an app-like icon. In Chrome, use ⋮ → **Cast, save and share → Install page as app**.

> **IF IT DOESN'T LOAD**
> Run `docker compose logs caddy`. "no such host" or certificate errors almost always mean the DNS record from chapter 05 isn't pointing at the server yet, or `DOMAIN` has a typo. Fix it and run `docker compose up -d --force-recreate`.

Make it yours: the Settings page

Click **Settings** at the top right (or go to `https://review.yourstudio.com/admin`). Everything saves as you change it and shows up on client links right away.

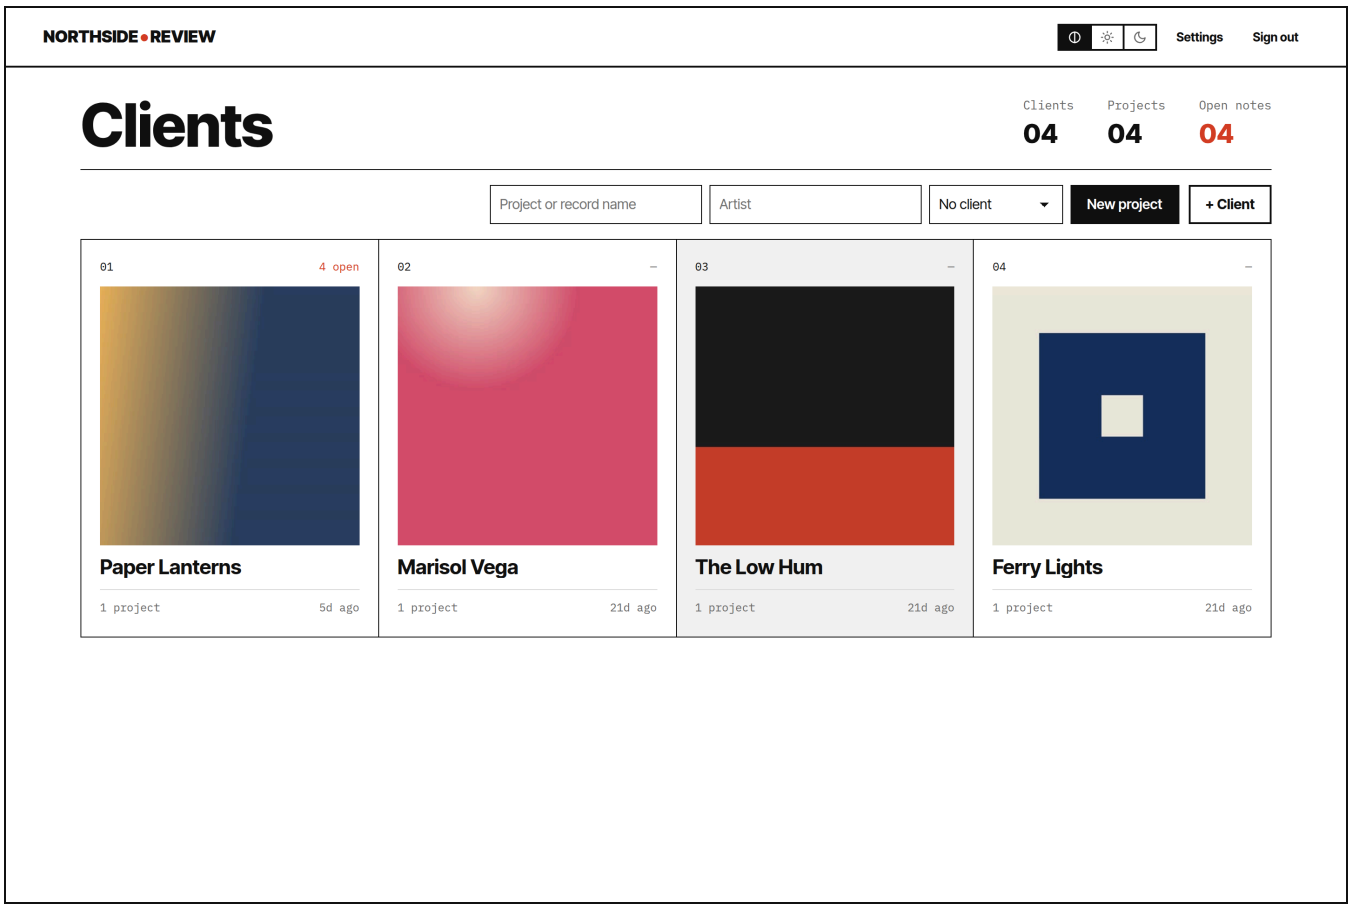

Studio name, logo, footer, default theme, font, accent color and backgrounds.

SETTING	WHAT IT DOES
Studio name	The name in the header and the browser tab. Two words look best; the dot goes between them.
Your name	Shown on the notes you leave.
Client page footer	A line at the bottom of every page, e.g. your studio, city and website.
Logo	Optional. Replaces the wordmark. Use a wide PNG with a transparent background.
Default theme	What clients see first: match their system, light or dark. They can still switch.
Font	Six bundled grotesks, or the system font.
Accent color	Buttons, note markers and the wordmark dot. Pick a preset or any color.
Backgrounds	White, warm paper or cool grey for light mode; black, charcoal or midnight for dark.

About Studio Review at the bottom of the page lists who made the software and the full MIT license.

09 Clients, projects, uploads

Everything is organized as **client** → **project** → **track** → **version**.

The home page shows each client with the art from their newest project.

1 **Add a client**

Click **+ Client** and type the band, artist or label name.

2 **Create a project**

Type the record name and artist, choose the client, and click **New project**.

3 **Drop in your bounces**

Drag WAV, AIFF, FLAC or MP3 files onto the project page. Name them like `Song Name_v1.wav`: the `_v1` tells Studio Review it's version 1. Next time, upload `Song Name_v2.wav` and it stacks as version 2 of the same song. Names like `Song - mix 4` and `Song rev5` work too.

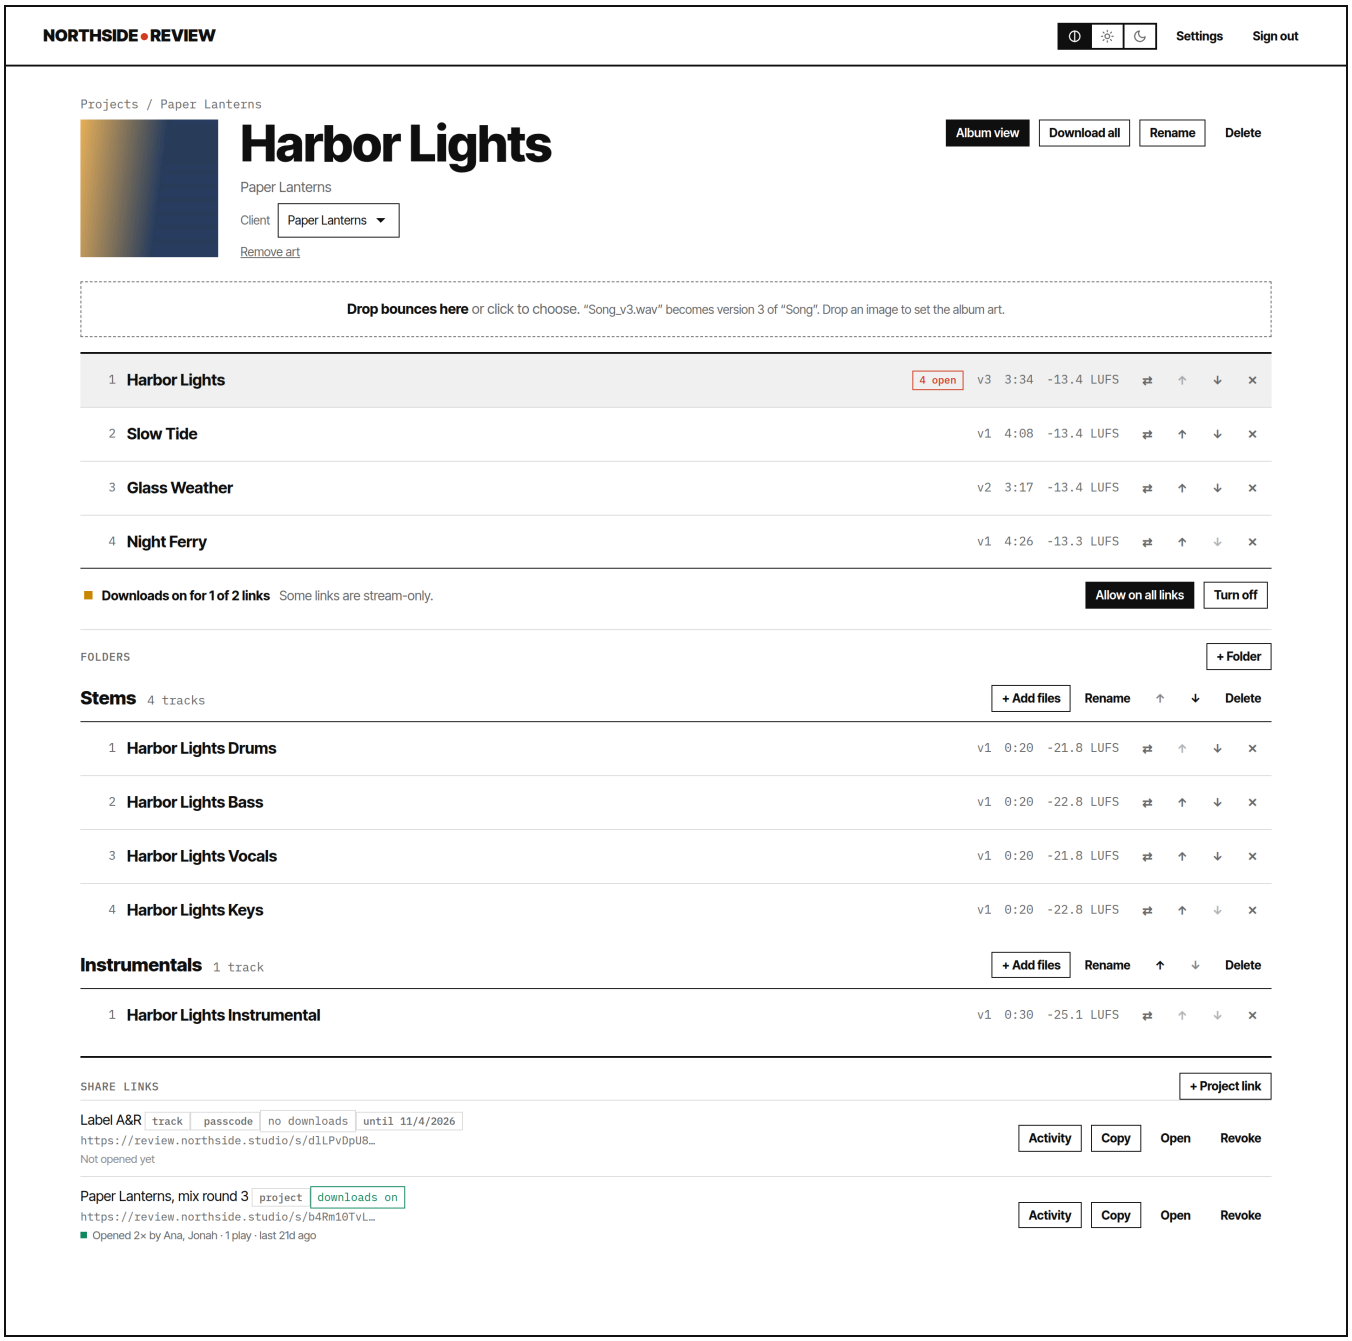

4 **Add album art**

Drag a JPG or PNG onto the project page, or click the cover square.

5

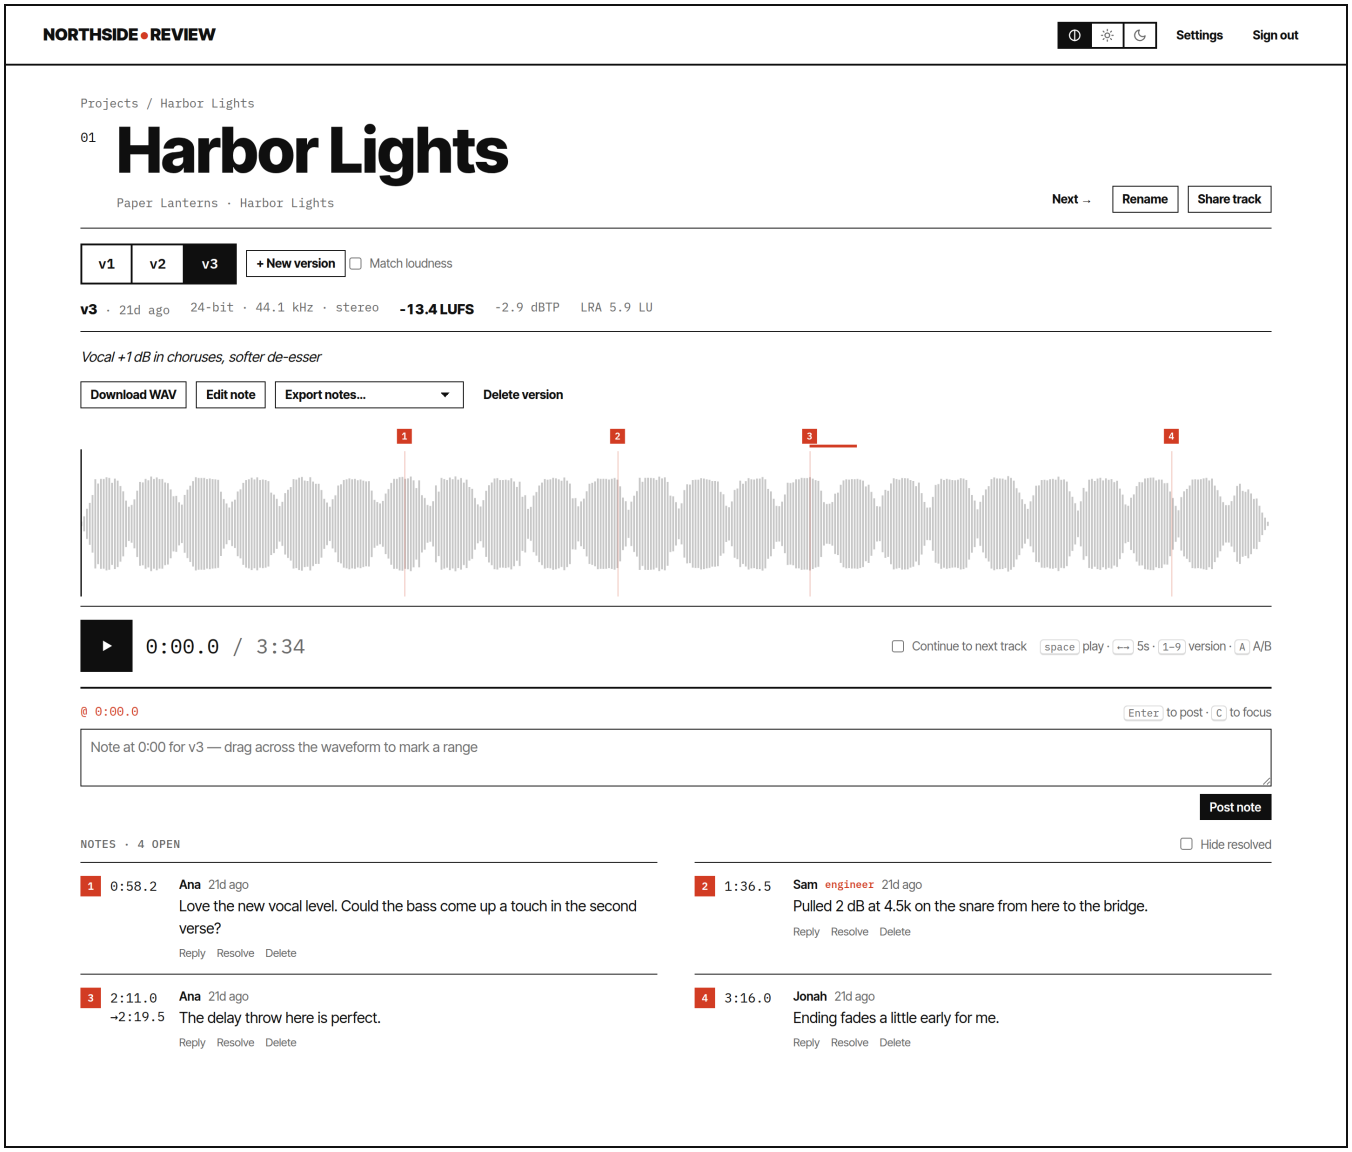

Optional: make folders

Under the main tracks, **+ Folder** makes a folder such as "Stems" or "Instrumentals". Drop files onto a folder to upload straight into it, or drag a track onto a folder to move it. Album view and the vinyl planner use only the main tracks, so stems never end up in your album sequence. Deleting a folder moves its tracks back to the main list; nothing is deleted.

A project page: tracks with their latest version, length and loudness, plus share links at the bottom.

The track page

Versions across the top, loudness for each version, and numbered notes pinned to the waveform.

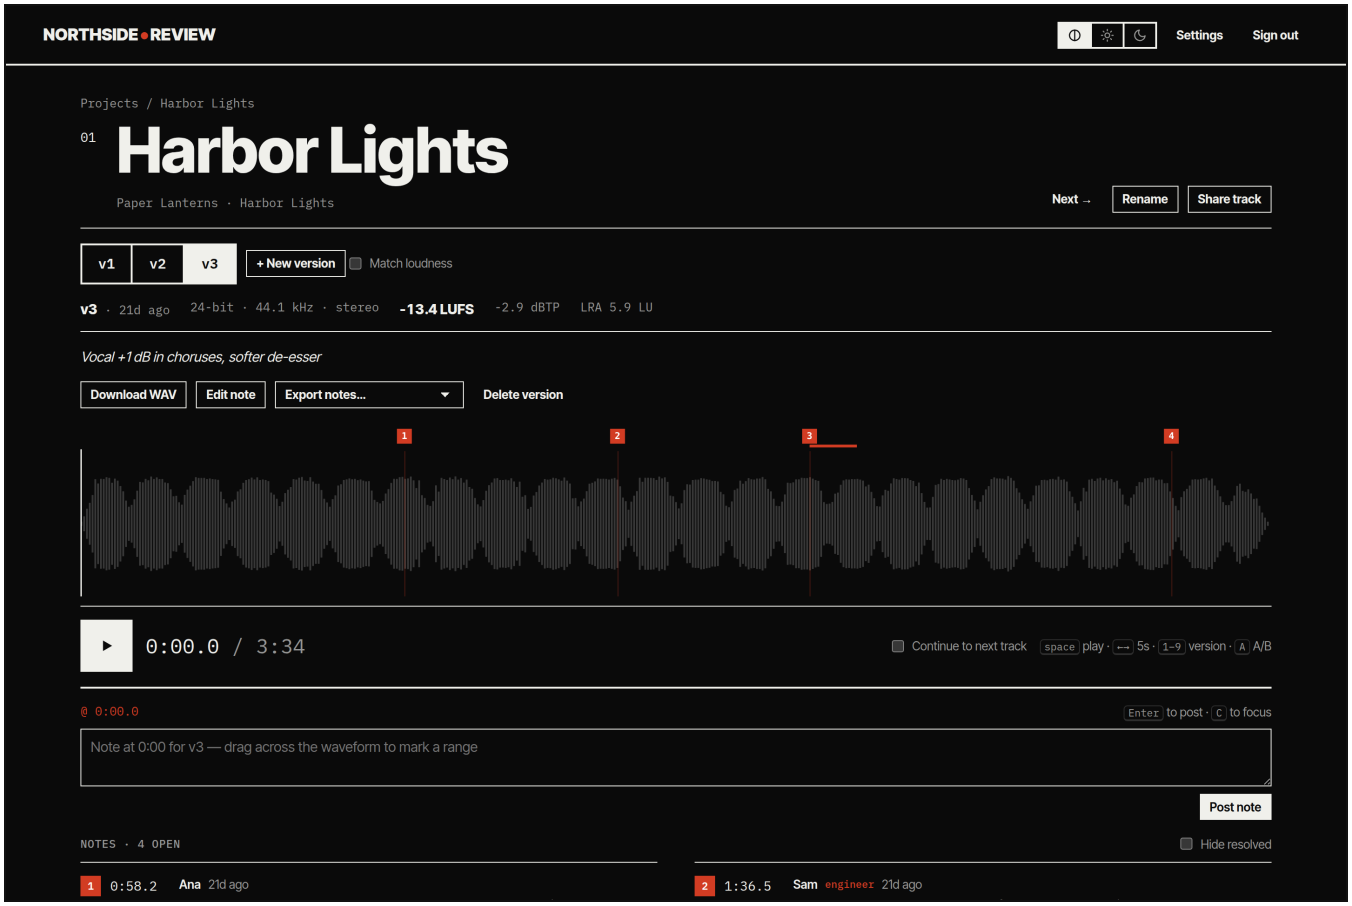

Working on a track

- **Click** the waveform to jump there. **Drag** across it to mark a range (for notes like "this whole chorus").
- Press **C** and type to leave your own note at the playhead. Enter posts it.
- Switch versions with the **v1 v2 v3** buttons or keys **1–9**. The playhead stays put, so you hear the same spot. **A** flips back to the last version.
- **Match loudness** turns louder versions down to the quietest, so you compare mixes, not volume.
- **Resolve** notes as you fix them. **Export notes** gives a revision list, Reaper markers or a spreadsheet.

KEY	DOES	KEY	DOES
Space	Play / pause	1–9	Switch version
← →	Back / forward 5 s	A	Previous version
0	Back to start	C	Write a note
Esc	Clear range	Enter	Post note

Dark mode

The three buttons at top right switch between **auto** (follows your computer), **light** and **dark**. Each browser remembers its choice, and clients get the same switch.

Dark theme.

10 Sharing with clients

Clients don't need an account or an app. They open a link, type their name once, and start leaving notes.

1 **Make a link**

On a project page, click **+ Project link** (the whole record, including songs you add later). On a track page, **Share track** makes a link for just that song.

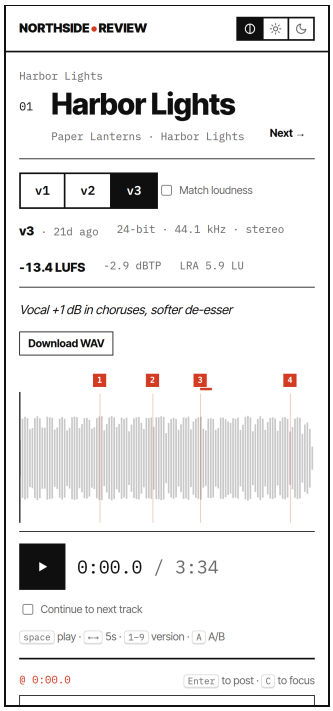

2 **Choose the options**

- **Label:** for you, e.g. "Band, mix round 2" or "Label A&R".
- **Passcode** (optional): the client types it once.
- **Expires** (optional): the link stops working after that date.
- **Allow downloading the original files:** lets them download the original WAVs, one at a time or all at once with **Download all**. Off means stream only.

3 **Send it**

Click **Copy** and paste the link into a text or email. **Revoke** cuts off a link instantly.

> TURNING DOWNLOADS ON LATER
> When the client is ready for masters, use the bar right under the song list: **Allow downloads** turns downloads on for every link on the project at once, and **Turn off** puts them back to stream only. Each link in Share links also has its own **downloads on / no downloads** toggle. Clients see the change when they reload the page.

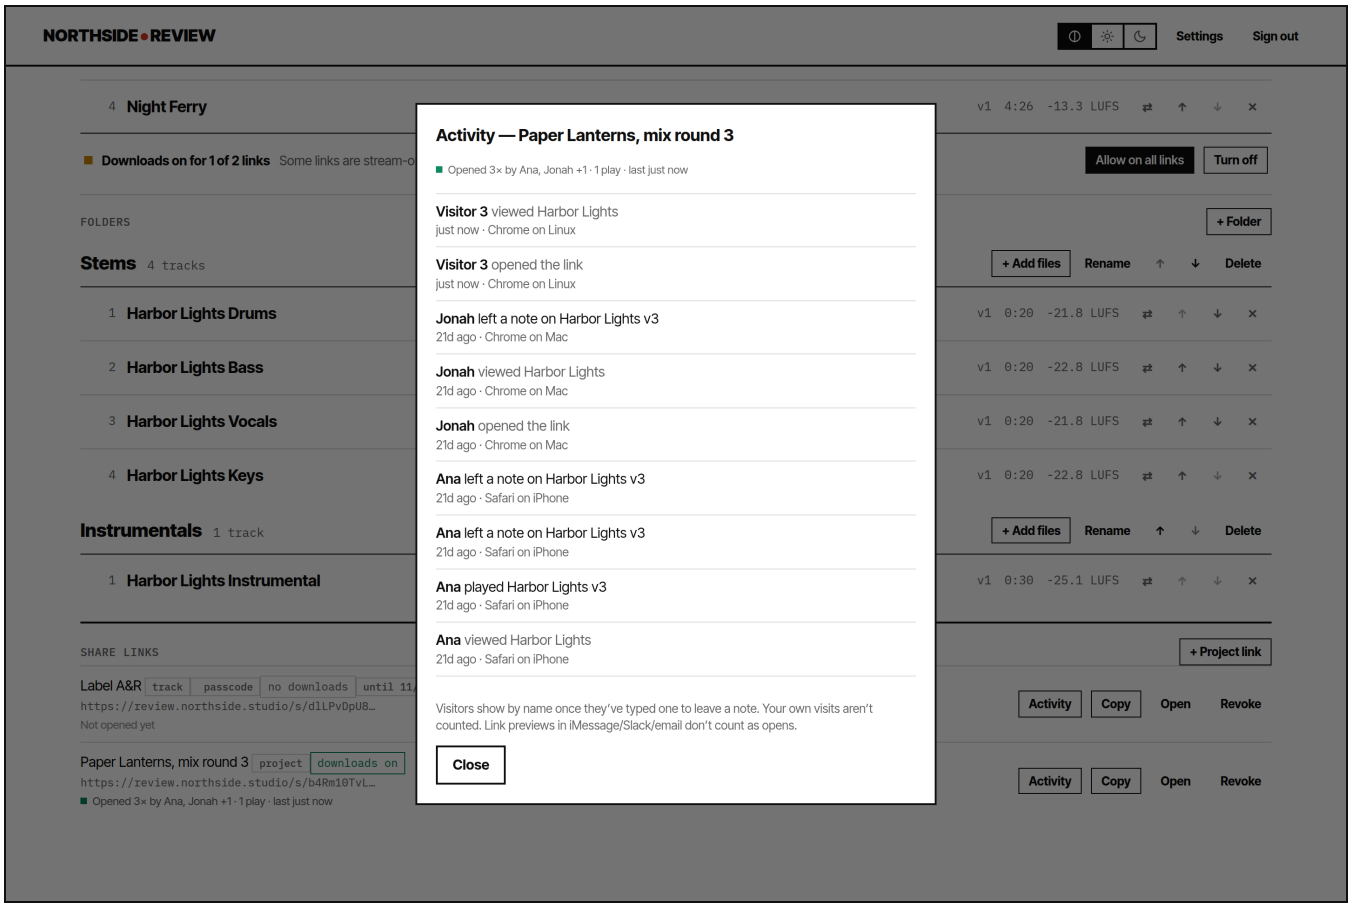

What a client sees on their phone.

Who opened it?

Under each link you'll see whether it's been opened, by whom, and when. **Activity** shows a full timeline: opens, plays, notes and downloads, with the device used.

Clients appear as "Visitor 1, 2…" until they type a name to leave a note. Your own visits aren't counted, and link previews in iMessage, Slack or email don't count as opens.

> **TIP**
> Name links after who you're sending them to ("Label A&R", "Drummer") and the Activity list tells you exactly who has listened.

A link's activity timeline. Only you can see this.

Privacy

- Links are long random codes that can't be guessed. Nobody can browse your server or find projects without a link.
- Search engines are told not to index the site.
- Clients only see what that link covers: one project or one track.
- Clients stream a compressed copy (256 kbps AAC). Your original files are never touched and are only downloadable if you allow it.

11 Phone notifications

optional · 5 min

Get a push on your phone when a client opens a link for the first time or leaves a note. It uses **ntfy**, a free notification app.

1 **Install ntfy**

From the App Store or Google Play. No account needed.

2 **Pick a secret topic name**

Make up something long and unguessable, e.g. `northside-notes-x8k2q9`. Anyone who knows the name can read the notifications, so don't use just your studio name. In the app, tap **+** and subscribe to that topic.

3 **Add it in Settings**

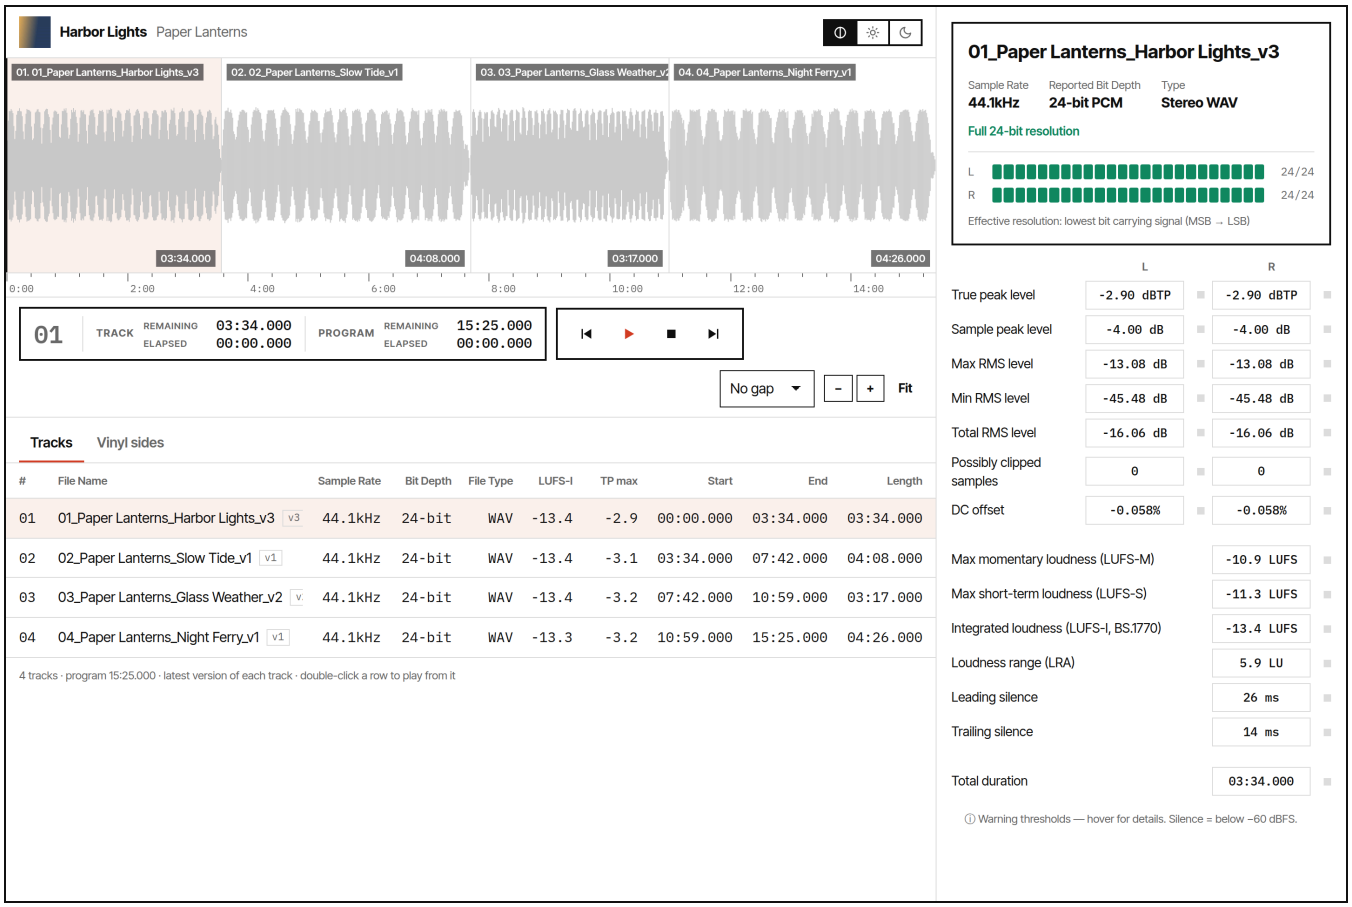

In Studio Review, click **Settings** at the top right. Under **Notifications**, paste your topic address:

```
https://ntfy.sh/northside-notes-x8k2q9
```

It saves as you type. Press **Send a test**, and your phone should buzz within a few seconds.

12 Album view & vinyl

For mastering: **Album view** on a project page opens a separate window with the latest version of every track laid end to end, measured and ready to play as a program. Only you can see it.

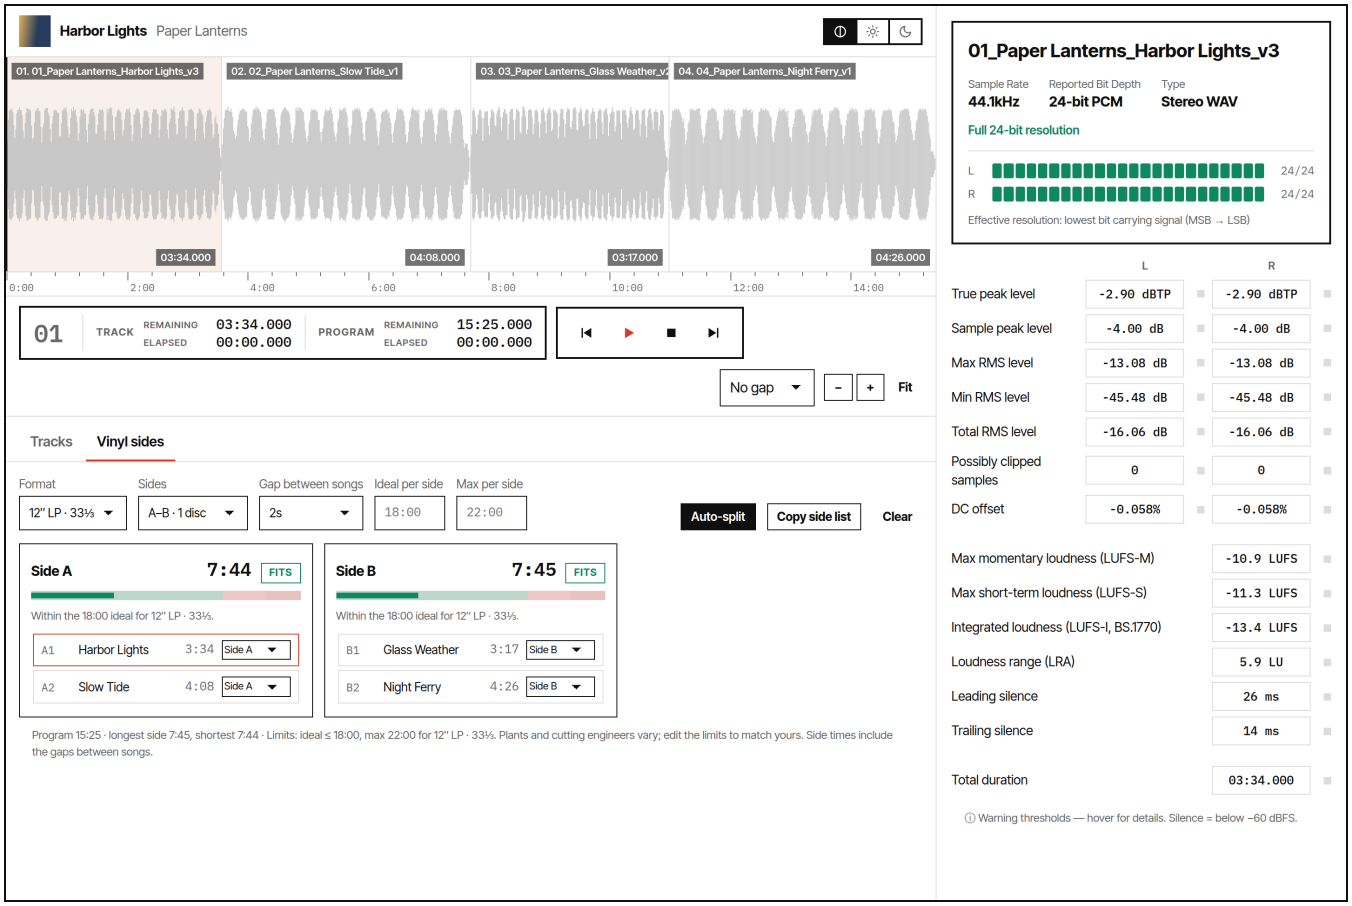

Album view: program waveform, track/program clocks, track table and the QC panel for the selected track.

- **Gapless, lossless playback** of the original files in order. Choose a gap between tracks (none up to 4 s).
- Click a track to see its **QC panel**: true peak, sample peak, RMS, possibly-clipped samples, DC offset, effective bit depth, momentary/short-term/integrated loudness, LRA, and leading/trailing silence.
- Small dots flag problems: **amber** to check, **red** to fix (e.g. true peak above −1 dBTP, clipped samples). Hover for details.
- Keys: Space play, ↑ ↓ select track, Enter play selected, [ ] previous/next, +/− zoom.

Vinyl sides

Open the **Vinyl sides** tab in Album view to plan a record.

Two sides on a 12″ LP at 33⅓, both comfortably inside the ideal length.

1 **Pick the format**

12″, 10″ or 7″ at 33⅓ or 45 rpm, and how many sides (A–B, A–D or A–F).

2 **Arrange the songs**

Click **Auto-split** to keep the album order and balance the sides, or drag songs between sides yourself.

3 **Read the meters**

Green fits. **Amber** is tight (cuttable, but usually at lower level or with less bass). **Red** is over the maximum. Ideal and maximum times are editable to match your plant or cutting engineer.

4 **Send the plan**

Copy side list gives a plain-text cue sheet to paste into an email to the plant. The plan is saved with the project.

13 Keeping it running

Volume snapshots (backups)

Everything (database, original masters, artwork) lives on your volume. In DigitalOcean go to **Backups & Snapshots** → **Volumes** (or **Volumes** → ⋯ → **Take snapshot**) and take a snapshot after every big session or once a week. Snapshots cost about $0.06/GB/month. To restore, create a new volume from the snapshot and attach it.

Belt and braces: copy the files to a drive at the studio from time to time.

```
# On your computer: copies everything from the server into a folder called review-backup
rsync -av review:/mnt/volume_nyc1_01/review/ ~/review-backup/
```

Updating to a new version of Studio Review

Unzip the new version on your computer, then upload it (your `.env` and audio are left alone) and rebuild:

```
rsync -av --exclude node_modules --exclude data --exclude .env \
  --exclude docker-compose.yml ~/Downloads/studio-review/ review:/opt/studio-review/
ssh review "cd /opt/studio-review && docker compose up -d --build"
```

Excluding `docker-compose.yml` keeps your volume setting. Browsers pick up the new interface on their next visit.

Changing your password (or forgotten it)

```
ssh review
cd /opt/studio-review
nano .env                              # change ADMIN_PASSWORD, save, exit
docker compose up -d --force-recreate
```

Too many wrong tries locks sign-in for 15 minutes. Recreating the app (above) clears the lock immediately.

Keeping the server patched

Once a month or so:

```
ssh review
apt update && apt upgrade -y
reboot                                 # only if it says a restart is required
```

Studio Review starts again by itself after a reboot.

Seeing what's happening

```
cd /opt/studio-review
docker compose ps                    # is it running?
docker compose logs -f review        # live app log; Control-C to stop watching
df -h /mnt/*                         # how full is the volume?
```

Running out of space

In DigitalOcean, open the volume and click **Resize**. Then on the server run `resize2fs /dev/disk/by-id/scsi-0DO_Volume_NAME` (DigitalOcean shows the exact command on the resize screen). No downtime needed.

14 Troubleshooting

These are the real problems people hit while setting this up, and how to fix them.

PROBLEM	FIX
"Wrong password" but you're sure it's right	Your password probably contains `$` or quotes. Change it in `.env` to one without them, then `docker compose up -d --force-recreate`.
Changed `.env` but nothing happened	Use `docker compose up -d --force-recreate`, not `restart`.
"Too many attempts"	Wait 15 minutes, or run `docker compose up -d --force-recreate`.
Site won't load, or certificate warning	Check DNS with `ping review.yourstudio.com`; it must show your server's IP. Check `DOMAIN` in `.env` (no `https://`, no slash). Then recreate and look at `docker compose logs caddy`.
`ssh review`: "Could not resolve hostname review"	The `~/.ssh/config` entry from chapter 04 is missing or misspelled. Or use `ssh root@YOUR_SERVER_IP`.
`ssh`: "Permission denied (publickey)"	The server doesn't have this computer's key. See "Lost your SSH key" below.
Forgot the SSH key passphrase	There's no way to recover it. Make a new key and add it, as below.
Pink/purple "sshd_config" screen during upgrade	Choose "keep the local version currently installed".
Nothing in `/mnt/volume-nyc1-01`	Use underscores: `ls /mnt` shows the real name.
`npm`: ENOENT package.json	You're not in the studio-review folder. `cd` into it first.
ntfy notifications don't arrive	Use **Settings** → **Notifications** → **Send a test**. The topic must exactly match the one you subscribed to in the app.
Album view says "Analyzing..."	Analysis runs once per new version and takes a few seconds per track. Close and reopen the window.
Upload fails on huge files	The limit is 4 GB per file. Check free space with `df -h /mnt/*`.
Interface looks old after an update	Reload the page once (Cmd-Shift-R).

Lost your SSH key, new computer, or forgotten passphrase

1 **Make a new key on this computer**

Follow chapter 03. If it asks to overwrite the old one, answer **y**.

2

Open the server's web console

In DigitalOcean, open your droplet → **Access** → **Launch Droplet Console**. A terminal opens in your browser, already logged in.

3

Add the new key

Copy your new public key on your computer (`pbcopy < ~/.ssh/id_ed25519.pub`), then in the web console type the line below, pasting your key between the quotes:

```
echo "PASTE_THE_WHOLE_ssh-ed25519_LINE_HERE" >> ~/.ssh/authorized_keys
```

Now `ssh review` works from your computer again.

15 Cheat sheet

Log in with `ssh review`, then `cd /opt/studio-review`, before any of these.

COMMAND	WHAT IT DOES
`docker compose up -d --build`	Start, or rebuild after updating the app
`docker compose up -d --force-recreate`	Apply changes to `.env`
`docker compose ps`	Is it running?
`docker compose logs -f review`	Watch the app's log
`docker compose logs caddy`	HTTPS / certificate log
`docker compose down`	Stop everything (your data stays)
`nano .env`	Edit settings
`df -h /mnt/*`	Free space on the volume
`apt update && apt upgrade -y`	Patch the server

Server settings in `.env`

Studio name, your name and notifications can also be changed any time on the Settings page, which takes priority.

SETTING	WHAT IT DOES
`ADMIN_PASSWORD`	Your sign-in password (8+ characters, no `$` or quotes)
`DOMAIN`	Your review address, e.g. `review.yourstudio.com`
`BRAND`	Name in the header
`OWNER_NAME`	Your name on notes
`NTFY_URL`	Phone notifications (easier on the Settings page, chapter 11)
`WATCH_DIR`	Auto-import folder (advanced; see README)

Where things are

PATH ON THE SERVER	CONTENTS
`/opt/studio-review`	The app and its settings (`.env`)
`/mnt/…/review/review.db`	The database: clients, projects, notes, links

`/mnt/…/review/originals`	Your untouched masters
`/mnt/…/review/art`	Album covers

Studio Review

Created by Dereck Blackburn / Quiethouse Recording. Released under the MIT License: free to use, modify and share, including commercially, as long as the copyright notice stays with it. Fonts: Inter Tight and IBM Plex Mono (SIL Open Font License 1.1).

The README in the folder has the technical details for developers.
